**Dual action of liraglutide and insulin degludec in type 2 diabetes: A trial comparing the efficacy and safety of insulin degludec/liraglutide, insulin degludec and liraglutide in subjects with type 2 diabetes**

This trial is conducted globally.
The aim of this trial is to compare the efficacy and safety of insulin degludec/liraglutide (IDegLira) versus insulin degludec (IDeg) and liraglutide (Lira) in subjects with type 2 diabetes. Subjects are to continue their pre-trial treatment with metformin or metformin + pioglitazone throughout the entire trial.

**Scientific Title**
A 26 week randomised, parallel three-arm, open-label, multi-centre, multinational treat-to-target trial comparing fixed ratio combination of insulin degludec and liraglutide versus insulin degludec or liraglutide alone, in subjects with type 2 diabetes treated with 1-2 oral anti-diabetic drugs (OADs) with a 26 week extension

Insulin degludec treatment will be initiated with 10 U and titrated (individually adjusted) twice weekly according to the mean SMPG (fasting). Insulin degludec is injected subcutaneously (under the skin) once daily.

- **IDegLira (Experimental):**  
  Arm description:  
  Drug: insulin degludec/liraglutide  
  Insulin degludec/liraglutide treatment will be initiated and titrated (individually adjusted) twice weekly according to the mean self measured plasma glucose (SMPG) (fasting). Insulin degludec/liraglutide is injected subcutaneously (under the skin) once daily.

- **Lira (Experimental):**  
  Arm description:  
  Drug: liraglutide  
  Liraglutide will be started with 0.6 mg and subsequent 0.6 mg weekly dose escalation to 1.8 mg. Liraglutide dose of 1.8 mg/day will be continued for the remaining part of the trial. Liraglutide is injected subcutaneously (under the skin) once daily.

### Trial status
- **Completed**

### No. of trial participants
- **1663**

### Age eligible for trial participation
- **18 years and above**

### Genders eligible for trial participation
- **Both**

### Inclusion criteria
- Subjects with type 2 diabetes  
- HbA1c 7.0-10.0 % (both inclusive) with the aim of a median HbA1c of 8.3%. Accordingly, when approximately 50% of the randomised subjects have a HbA1c above 8.3%, the remaining subjects randomised must have a HbA1c of below or equal to 8.3%, or when approximately 50% of the randomised subjects have a HbA1c of below or equal to 8.3%, the remaining subjects randomised must have a HbA1c above 8.3%  
- Male or female, age 18 years or above (Taiwan: 20 years or above for a site 653 in Taiwan: Taichung Veterans General Hospital)  
- Subjects on stable dose of 1-2 OADs (metformin [at least 1500 mg or max tolerated dose] or metformin [at least 1500 mg or max tolerated dose] + pioglitazone [at least 30 mg]) for at least 90 days prior

### Exclusion criteria
- Treatment with insulin (except for short-term treatment due to intercurrent illness at the discretion of the Investigator)  
- Treatment with GLP-1 (glucagon-like peptide-1) receptor agonists (eg exenatide, liraglutide), sulphonylurea or dipeptidyl peptidase 4 (DPP-4) inhibitors within 90 days prior to trial  
- Impaired liver function, defined as alanine aminotransferase (ALAT) at least 2.5 times Upper Normal Range (UNR) (one retest analysed at the central laboratory within a week from first sample taken is permitted with the result of the last sample being the conclusive)  
- Impaired renal function defined as serum-creatinine at least 133 mcmol/l (at least 1.5 mg/dl) for males and at least 125 mcmol/l (at least 1.4) for females, or as allowed according to local contraindications for

to screening
- Body Mass Index (BMI) maximum 40 kg/m^2
- Metformin (one retest analysed at the central laboratory within a week from first sample taken is permitted with the result of the last sample being the conclusive)
- Screening calcitonin at least 50 ng/L
- Subjects with personal or family history of medullary thyroid carcinoma (MTC) or multiple endocrine neoplasia type 2 (MEN 2)
- Cardiac disorder defined as: congestive heart failure (NYHA class III-IV), diagnosis of unstable angina pectoris, cerebral stroke and/or myocardial infarction within the last 12 months and planned coronary, carotid or peripheral artery revascularisation procedures
- Severe uncontrolled treated or untreated hypertension (systolic blood pressure at least 180 mm Hg or diastolic blood pressure at least 100 mm Hg)
- Acute treatment required proliferative retinopathy or maculopathy (macular oedema)
- History of chronic pancreatitis or idiopathic acute pancreatitis

**Trial type**
Interventional

**Trial design**
Purpose: Treatment
Allocation: Randomized
Masking:
Control: Active Control
Assignment: Parallel Assignment

**Primary outcome**
- Mean change from baseline in HbA1c (glycosylated haemoglobin) at week 26
  Time frame: Week 0, week 26

**Secondary outcome(s)**
- Mean change from baseline in body weight at week 26
  Time frame: Week 0, Week 26
- Number of hypoglycaemic episodes
  Time frame: Weeks 0-26
- Change from baseline in incremental area under the curve 0-4h (iAUC0-4h) derived from the glucose concentration profile during meal test
  Time frame: Week 0, Week 26
- Mean actual daily insulin dose
  Time frame: Week 26
